```

#Adding a new column - "GradeClassified" that includes the final grades classified into three categories:

#Above averAge - classification for final grades between 15 and 20

#Below averAge - classification for final grades between 0 and 9

#AverAge - classification for final grades between 10 and 14

```
StudentData$GradeClassified <- ifelse(StudentData$FinalGrade<10,"BelowAverAge",
                                     ifelse((StudentData$FinalGrade>=10 & StudentData$FinalGrade<=15),"AverAge","AboveAverAge"))
```

#Convert GradeClassified as a factored variable with only 3 levels - Above AverAge, averAge and below averAge

```
StudentData$GradeClassified <- as.factor(StudentData$GradeClassified)
```

DATA EXPLORATION

Here we are slicing, dicing and factorising the data in various level for better analysis and also plotting them with each other and the response variable to understand the data in a better way

Average Grades

```
StudentData$AverAgeGrades <- round(rowMeans(cbind(StudentData$FirstPeriodGrade, StudentData$SecondPeriodGrade, StudentData$FinalGrade)),2)
```

No. of students drinking on Weekday and weekend

```
StudentData$WorkdayAlcohol<- as.factor(StudentData$WorkdayAlcohol)
```

```
StudentData$WorkdayAlcohol <- factor(StudentData$WorkdayAlcohol,labels=c("Very Low", "Low", "Medium", "High", "Very High"))
```

```
plot(StudentData$WorkdayAlcohol)
```

```
StudentData$WeekendAlcohol <- as.factor(StudentData$WeekendAlcohol)
```

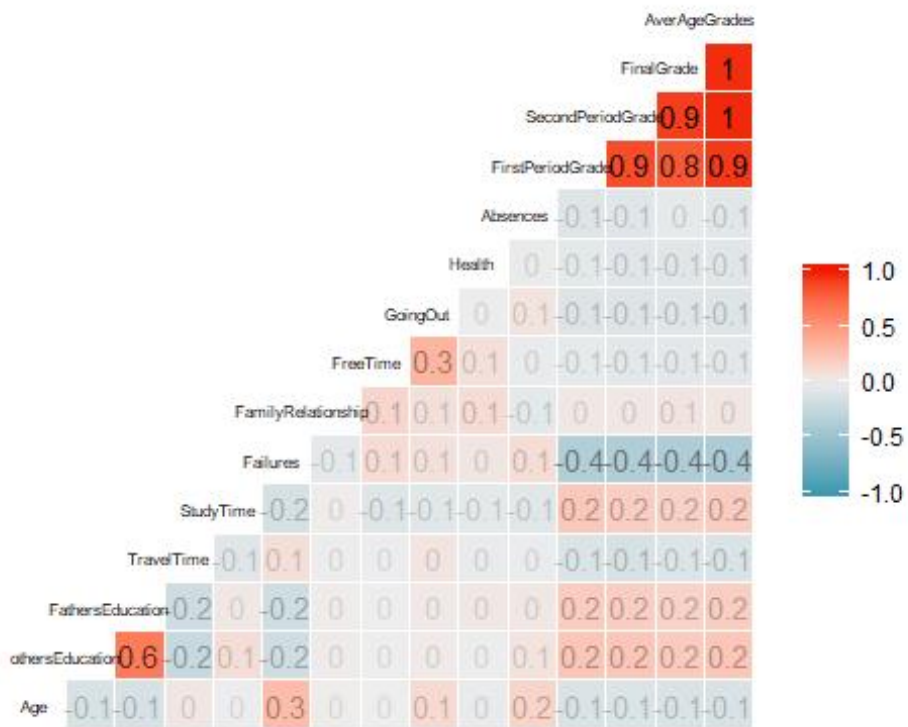

```
StudentData$WeekendAlcohol <- factor(StudentData$WeekendAlcohol,labels=c("Very Low", "Low", "Medium", "High", "Very High"))
```

```
plot(StudentData$WeekendAlcohol)
```

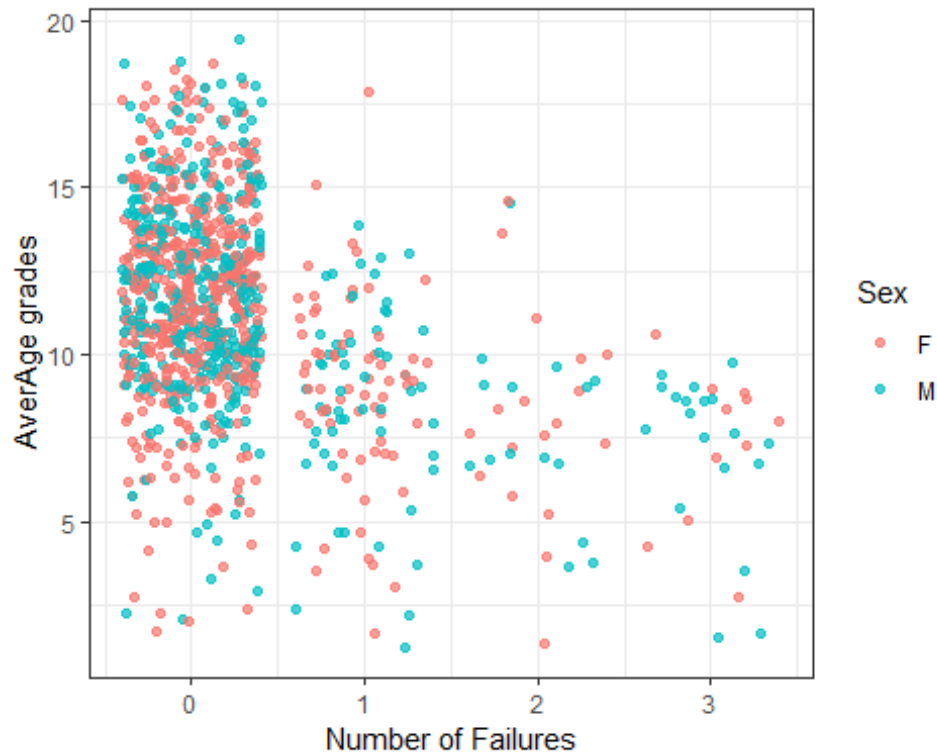

```
ggcorr(StudentData,label = TRUE,label_alpha = TRUE, hjust = 0.75, size = 2)

## Warning in ggcorr(StudentData, label = TRUE, label_alpha = TRUE, hjust
## = 0.75, : data in column(s) 'School', 'Sex', 'Address', 'FamilySize',
## 'ParentsMaritalStatus', 'MothersJob', 'FathersJob', 'ReasonToChooseSchool'
## 'Guardian', 'SchoolSupport', 'FamilySupport', 'PaidClasses',
## 'Activities', 'Nursery', 'HigherEducationInterest', 'InternetAcess',
## 'RomanticRelationship', 'WorkdayAlcohol', 'WeekendAlcohol',
## 'GradeClassified' are not numeric and were ignored
```

```
# Question - Does number of Failures affect your grades?
ggplot(StudentData, aes(x=Failures, y=AverAgeGrades, color=Sex))+
geom_jitter(alpha=0.7) +
theme_bw() +
  xlab("Number of Failures") +
  ylab("AverAge grades")
```

Observation - As number of Failures increases, grades decrease

Question - Does number of Failures affect your grades?

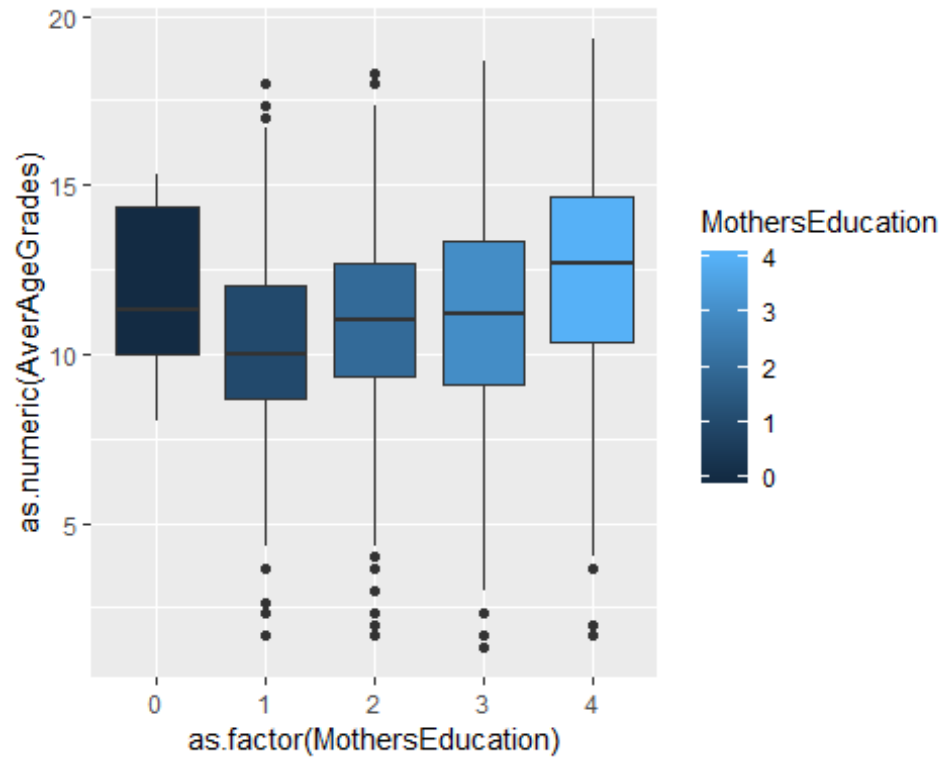

```
ggplot(StudentData, aes(x=as.factor(HigherEducationInterest), y=AverAgeGrades,
color=Sex))+
  geom_jitter(alpha=0.7) +
  theme_bw() +
  xlab("Number of Failures") +
  ylab("AverAge grades")
```

Observation - As number of Failures increases, grades decrease

Question - How does mother's education affect the grades?

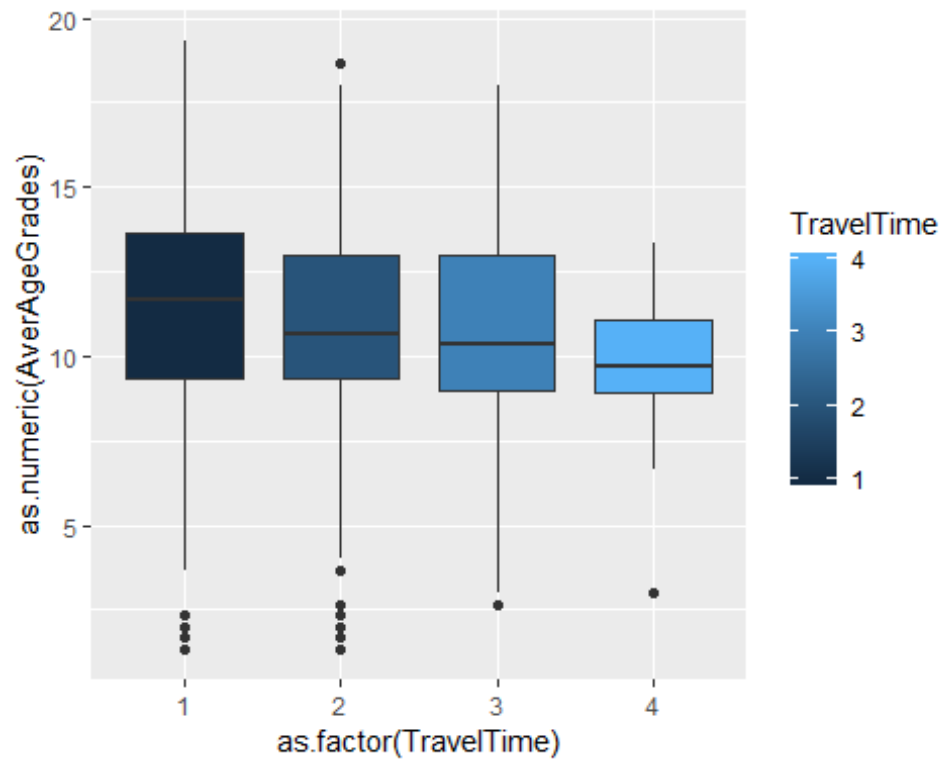

```
ggplot(StudentData, aes(x=as.factor(MothersEducation), y=as.numeric(AverAgeGrades), fill=MothersEducation))+  
  geom_boxplot()
```

Observation - Grades are better if mother is educated

Question - How does travel time affect the grades?

```
ggplot(StudentData, aes(x=as.factor(TravelTime), y=as.numeric(AverAgeGrades),  
fill=TravelTime))+  
  geom_boxplot()
```

Observation - Grades gets worse with increase in travel time

Question - How does going out affect the study time?

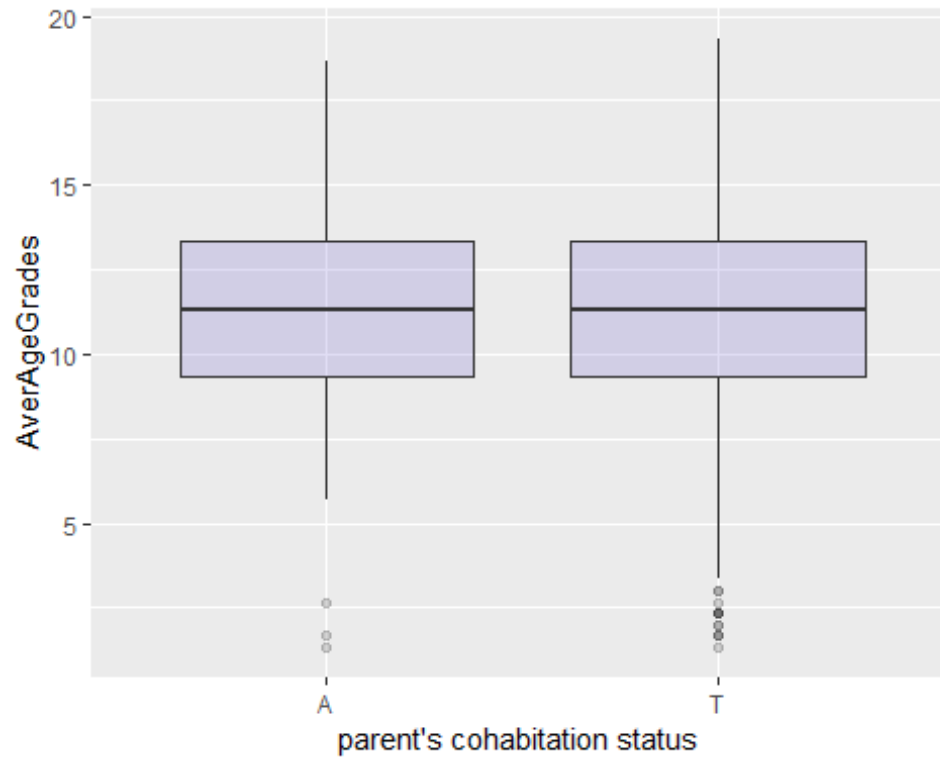

```
ggplot(aes(as.numeric(GoingOut), as.numeric(StudyTime)), data = StudentData)
+
  geom_jitter() +
  geom_smooth(se = FALSE, method = 'lm') +
  xlab("Frequency of Going Out with Friends") +
  ylab("Time Spent Studying")
```

Observation - Going out with friends will lead to lessening of study time

Some other random observations

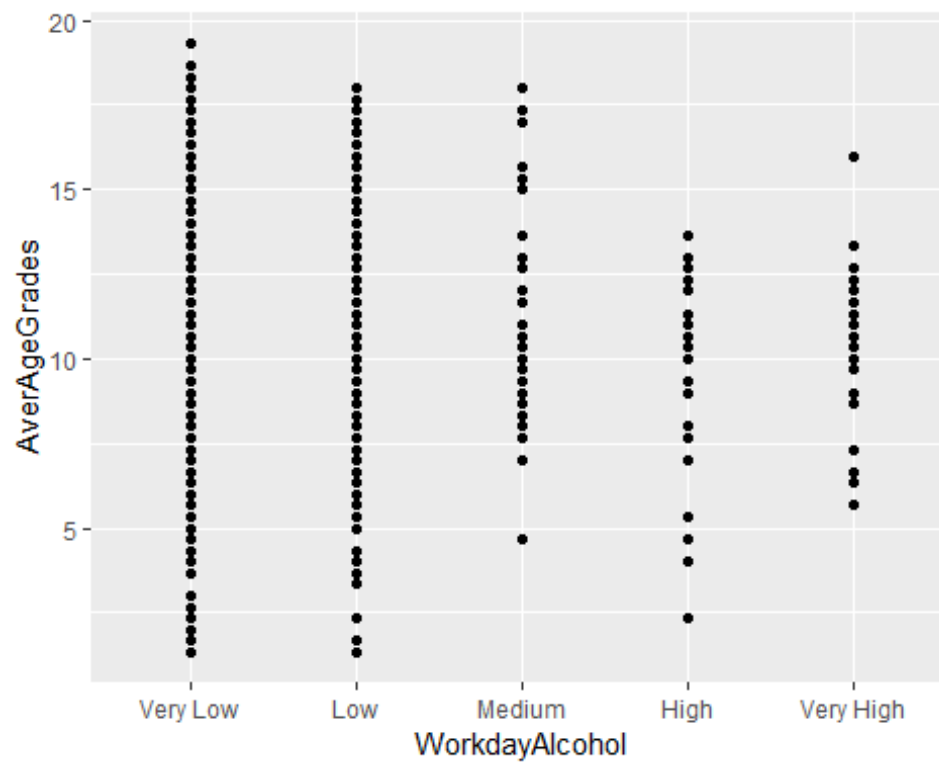

```
ggplot(StudentData, aes(x=as.factor(ParentsMaritalStatus), y=AverAgeGrades))
+
  geom_boxplot(fill="slateblue", alpha=0.2) +
  xlab("parent's cohabitation status ")
```

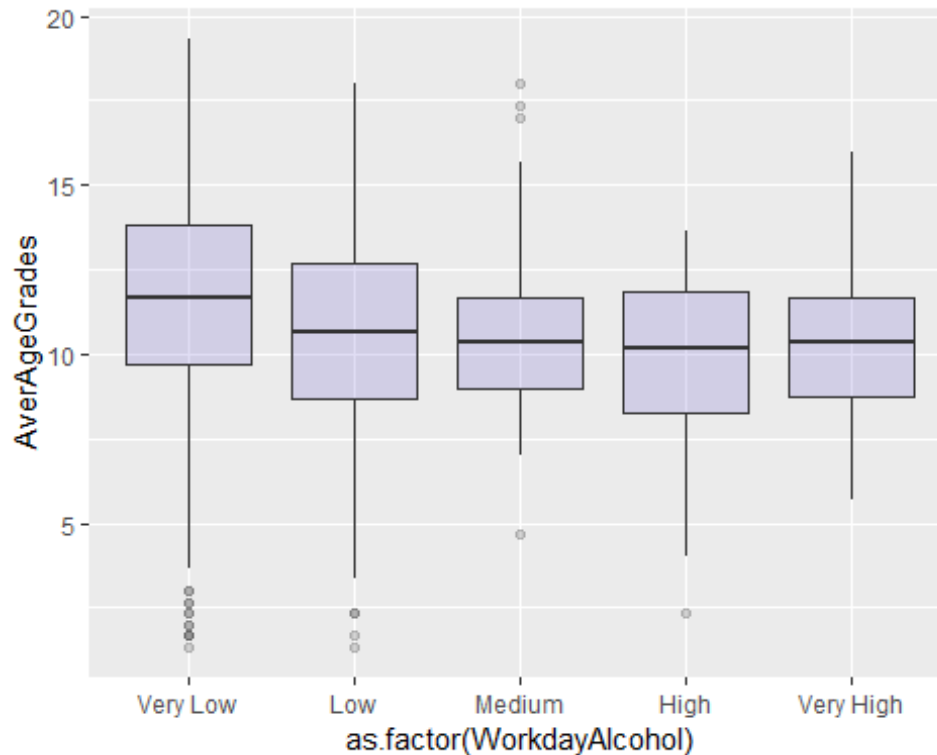

```
ggplot(StudentData, aes(x=FreeTime, y=AverAgeGrades)) +  
  geom_point()
```

```
ggplot(StudentData, aes(x=WorkdayAlcohol, y=AverAgeGrades)) + geom_point()
```

```
ggplot(StudentData, aes(x=as.factor(WorkdayAlcohol), y=AverAgeGrades)) +  
  geom_boxplot(fill="slateblue", alpha=0.2)
```

#Question - What is the overall grade distribution of the students?

```
NumberOfStudents <- as.data.frame(sort(table(StudentData$GradeClassified, dnn
= 'GradeClassified'), decreasing = T),responseName = 'NumberOfStudents')

ggplot(aes(x= reorder(GradeClassified,NumberOfStudents), y = (NumberOfStudent
s/sum(NumberOfStudents)), fill = GradeClassified), data = NumberOfStudents) +
  geom_bar(stat = 'identity') +
  geom_text(stat='identity', aes(label = percent((NumberOfStudents)/sum(Numbe
rOfStudents))),
          data = NumberOfStudents, hjust = 0.5,vjust=-0.5) +
  theme(axis.text = element_text(size = 12,face = "bold")) +
  xlab("GradeClassified") +
  ylab("Percentage of Students") +
  ggtitle("Percentage of Students in the Grade classified categories")
```

Observation - Maximum students lie in the Average Grade category with 66% ratio followed by below average and above average

#Question - How does a romantic relationship affects the grade ?

```
ggplot(aes(x=GradeClassified, fill = RomanticRelationship),
  data = StudentData) +
  geom_histogram(stat = "count", position=position_dodge()) +
  xlab("Grade Category") +
  ylab("Number of students") +
  ggtitle("Relationship of grade classified with a Student's Romantic Relationship")
```

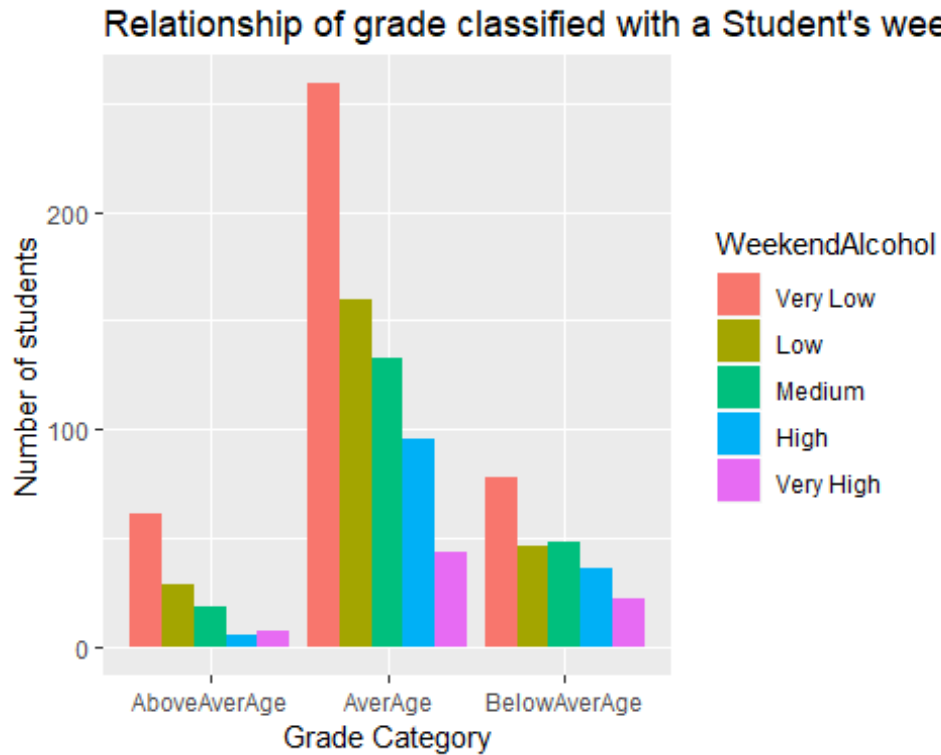

Warning: Ignoring unknown parameters: binwidth, bins, pad

Observation - Students not involved in romantic relationships tends to score higher than the ones who are in it.

```
# How does the intake of alcohol during the weekend affect the grade
StudentData$WeekendAlcohol <- as.factor(StudentData$WeekendAlcohol)
ggplot(aes(x=GradeClassified, fill = WeekendAlcohol),
       data = StudentData) +
  geom_histogram(stat = "count", position=position_dodge()) +
  xlab("Grade Category") +
  ylab("Number of students") +
  ggtitle("Relationship of grade classified with a Student's weekend alcohol
consumption ")
```

```
## Warning: Ignoring unknown parameters: binwidth, bins, pad
```

Observation - Students into high level of weekend alcohol intake tends to score much less

```
# Better visualization of the above problem with geom point
ggplot(aes(x=WeekendAlcohol, y = GradeClassified, color = GradeClassified),
  data = StudentData) +
  geom_point(alpha = 0.5, position="jitter") +
  scale_colour_brewer(palette = 'Set1') +
  theme_bw() + theme(legend.key = element_blank()) +
  xlab("Weekend alcohol") +
  ylab("Grade Category") +
  ggtitle("Relationship of Final grade with weekend alcohol consumption ")
```

Checking the dependency of Grade classified with Weekeend Alcohol consumpti on using Chi-Square Test

```
chisq.test(StudentData$GradeClassified, StudentData$WeekendAlcohol)
```

```
##
```

```
## Pearson's Chi-squared test
```

```
##
```

```
## data: StudentData$GradeClassified and StudentData$WeekendAlcohol
```

```
## X-squared = 18.151, df = 8, p-value = 0.02012
```

P-Value is less than the significant value so the null hypothesis should be rejected and conclude that grades are affected by weekend alcohol pattern

Are Grade classified and Mother's Education related?

```
StudentData$MothersEducation <- as.factor(StudentData$MothersEducation)
```

```
ggplot(aes(x=GradeClassified, fill = MothersEducation),
       data = StudentData) +
```

```
  geom_histogram(stat = "count", position=position_dodge()) +
```

```
  xlab("Grade Category") +
```

```
  ylab("Number of students") +
```

```
  ggtitle("Relationship of grade classified with a Student's Mother's Educati on")
```

```
## Warning: Ignoring unknown parameters: binwidth, bins, pad
```

Not a clear pattern here for all the level of grades, though mothers of students with above average grade are more educated

Above problem in different visualization

```
ggplot(aes(y=MothersEducation, x = GradeClassified, color = GradeClassified),
       data = StudentData) +
  geom_point( alpha = 1, position="jitter") +
  scale_colour_brewer(palette = 'Set2') +
  theme_bw() + theme(legend.key = element_blank()) +
  ylab("Mothers Education") +
  xlab("Grade Category") +
  ggtitle("Relationship of Final grade with a Student's Mother's Education ")
```

Question - What is the relationship of number of failures and grade score by a student?

```
StudentData$Failures <- as.factor(StudentData$Failures)
ggplot(aes(x=GradeClassified, fill = Failures),
  data = StudentData) +
  geom_histogram(stat = "count", position=position_dodge()) +
  xlab("Grade Category") +
  ylab("Number of students") +
  ggtitle("Relationship of grade classified with a Student's Failures ")
```

Warning: Ignoring unknown parameters: binwidth, bins, pad

Observation - students with no or less failure tends to score better grades

Another visualization for above problem

```
ggplot(aes(y=Failures, x = GradeClassified, color = GradeClassified),
       data = StudentData) +
  geom_point(alpha = 0.5, position="jitter") +
  theme_bw() + theme(legend.key = element_blank()) +
  scale_colour_brewer(palette = "Set1") +
  xlab("Grade category1") +
  ylab("Failures") +
  ggtitle("Relationship of Final grade with a Student's Failure ")
```

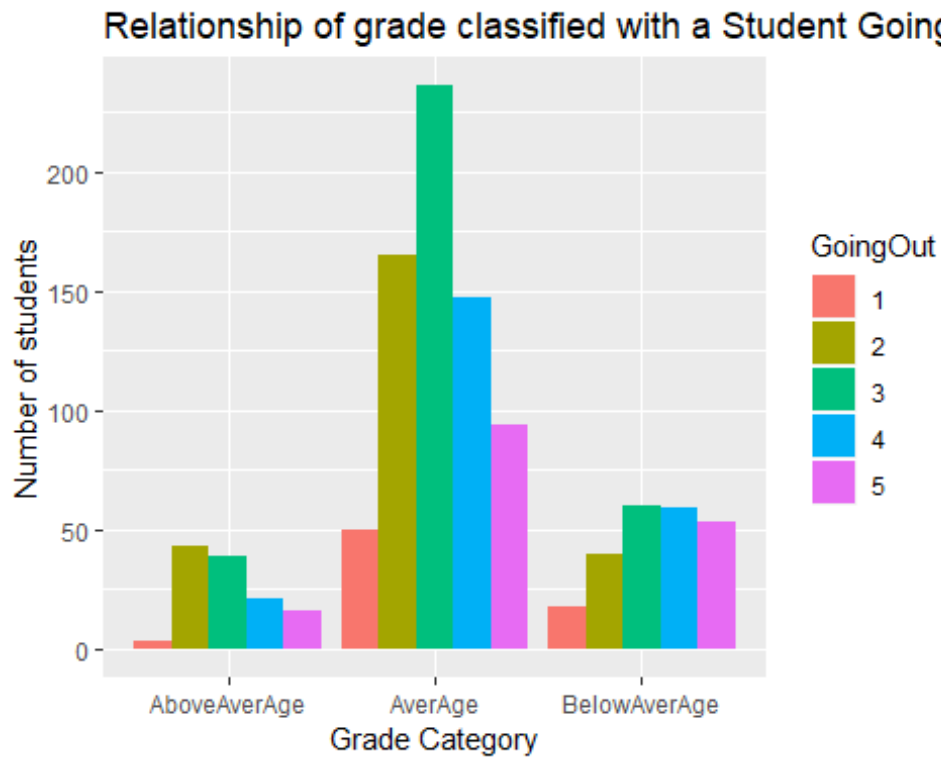

Question - How does going out pattern affect the grades?

```
StudentData$GoingOut <- as.factor(StudentData$GoingOut)
```

```
ggplot(aes(x=GradeClassified, fill = GoingOut),
       data = StudentData) +
  geom_histogram(stat = "count", position=position_dodge()) +
  xlab("Grade Category") +
  ylab("Number of students") +
  ggtitle("Relationship of grade classified with a Student Going Out ")
```

```
## Warning: Ignoring unknown parameters: binwidth, bins, pad
```

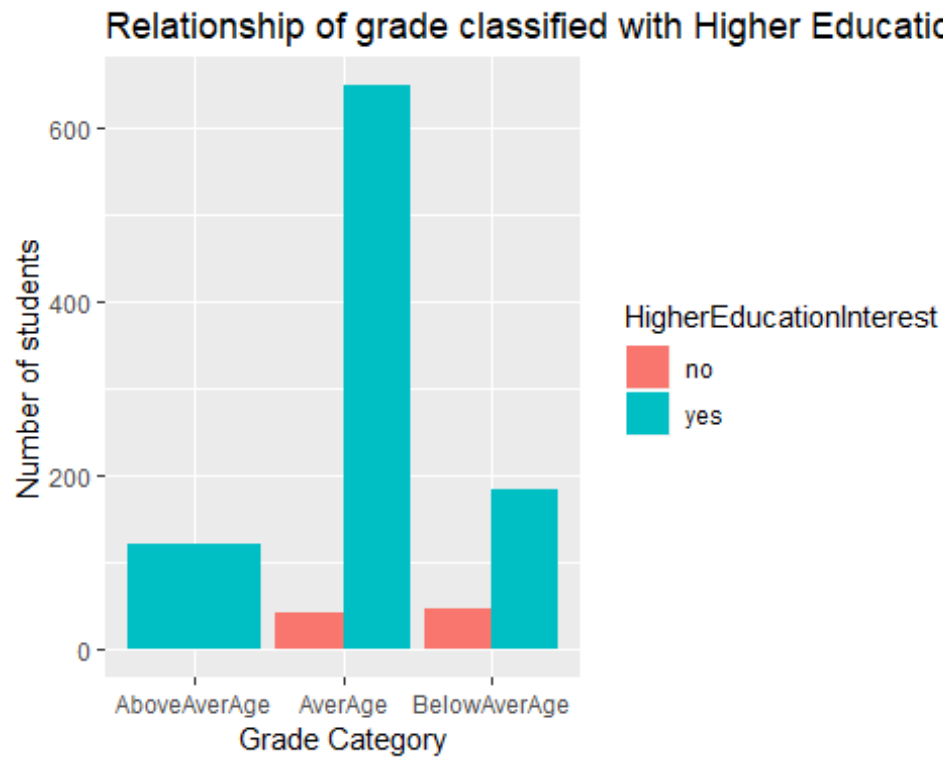

Observation - Not a specific pattern here

#Question - What is the grade of the students who aspire for higher education ?

```
ggplot(aes(x=GradeClassified, fill =HigherEducationInterest),
  data = StudentData) +
  geom_histogram(stat = "count", position=position_dodge()) +
  xlab("Grade Category") +
  ylab("Number of students") +
  ggtitle("Relationship of grade classified with Higher Education interest ")
```

Warning: Ignoring unknown parameters: binwidth, bins, pad

Observation - Almost all the students with good grades aspire for higher studies

Another visualization for above problem

```
ggplot(aes(x=HigherEducationInterest, y = GradeClassified, color = GradeClassified),
  data = StudentData) +
  geom_point(alpha = 0.5, position="jitter") +
  theme_bw() + theme(legend.key = element_blank()) +
  scale_colour_brewer(palette = 'Set2') +
  xlab("Higher Education Interest") +
  ylab("Grade Category") +
  ggtitle("Relationship of grade classified with Higher Education Interest ")
```

FIRST MODEL - MULTIPLE LINEAR REGRESSION METHOD IMPLEMENTATION

Influential attributes seems to be - **NUMERICAL** - Age, MothersEducation, FathersEducation, TravelTime, StudyTime, Failures, FamilyRelationship, WeekendAlcohol, WorkdayAlcohol, GoingOut, FreeTime

CATEGORICAL - FathersJob, MothersJob, ParentsMaritalStatus, ReasonToChooseSchool, InternetAccess, HigherEducationInterest, Guardian, School, Sex, Address, FamilySize, SchoolSupport, FamilySupport, PaidClasses, Activities, Nursery, RomanticRelationship,

```
StudentData1 <- StudentData[,c("Age", "MothersEducation", "FathersEducation", "
TravelTime", "StudyTime", "Failures",
                                "FamilyRelationship", "FreeTime", "WeekendAlcohol", "WorkdayAlcohol", "GoingOut", "Health", "Absences")]
```

```
unique(sort(StudentData$RomanticRelationship))
```
